

So IDA was refusing to disassemble the sub_201010 function which seemed the only one to actually do something, so I had to analyze it manually.

First, I switched to text view (from IDA view), copied the whole function into a text editor and deleted the extra stuff I copied. Then, I fed chatgpt the code and it explained to me the code simply does a xor (with looping key) between the predefined array and the key “dublin_guinness”.

So, I opened up cyberchef, pulled a from hex and xor blocks and started writing the hex characters manually (make sure to write all of them). A bit surprisingly, the flag was forming right before my eyes!
