

Opening the PCAP and looking through the packets a lot of EAPOL can be seen. This means there's WiFi traffic, which can be decrypted using aircrack-ng and rockyou.txt

Note: If an antivirus tells you aircrack-ng may be unsafe, ignore it. It's completely safe and only marked as virus since technically we are using it to crack a wifi connection.

Command used on kali linux: aircrack-ng -w rockyou.txt authentication.pcap

The password found needs to be hashed and we have the flag.
