

If we look in the source code of the website, we notice `<image src="local?image_name=static/path.jpg" align="middle">`. It looks like the website retrieves the file that it at the path indicated by the `image_name` parameter then displays it. This looks like a LFI vulnerability.

After some trial and error we can get the flag file with **`image_name=static//....//....//....//tmp/flag`**
