

After we enter the website, we look in the source code and we see `<!-- /admin.php -->`. When we access that file and look in its source code, we see it complains we are not local. We try to do `curl -H "Host: 127.0.0.1"`, but it fails. After a bit of trial and error, we see the header we needed is **X-Forwarded-For**, not **Host**. We rewrite the command and get the flag.
