

Since this challenge also has the steganography tag, we can assume we need to inspect the images we found using a tool like aperiolve.

The metadata seems to be the only thing of help. The important part of the metadata is the camera model. If we search it, we find a github gist page, which seems to be the next step!

So, here on the github page we can find a couple of odd things: first, there is a revision which includes some strange character edits. Next, we can see the mention of a holloway in New Zealand, which leads us to <https://holloway.nz/>. On this website there is a "Secret Message" Encoder/Decoder. If we paste the weird text from the revision in the decoder we get the flag.
