If you have done all other rev challenges so far, it should be obvious this binary was generated using Pyinstaller.

After extracting src.pyc and decompiling it with pylingual.io, we can start reading the source code.

It's a simple encryption using Salsa20. We just need to use the same key and nonce to decrypt the flag array.

Surprisingly easy, I wonder why this challenge has so few solves compared to zoom, which is strictly harder (IMO)
